Release Sign-off Report: UiBank Regression

Project UAPMEERA (MeeraUiPath Autopilot Playground) · Test set UAPMEERA:226 · Audience: Release Manager · Generated 2026-10-06

NO-GO

2 of 4 regression tests fail (50% pass rate). Both failures are consistent: they have failed in **every** run on record (4 of 4), so they are not flaky. Both fail on the same check: the loan API returns `Accepted = False`.

Summary

Execution	Automated - UiBank Regression Testing - 20261006.1116
Execution ID	`84e58c22-8ea2-1a00-1e7f-0b4a365e7e9f`
Run window (UTC)	2026-10-06 11:16:28 to 11:16:51 (21 s)
Status	Finished
Package under test	UiBankApplicationTesting 1.2.244905422 (Tenant Package Feed)
Robot / host	meera.kannan@uipath.com-unattended on UIP-PF2ZFW6K
Result	**2 passed · 2 failed · 0 none · 0 restricted · 50% pass rate**

Test Set

UiBank Regression Testing (UAPMEERA:226): 4 automated test cases from the UiBankApplicationTesting project, covering loan request submission scenarios.

Go / No-Go

Criterion	Value	Assessment
Success rate	50% (2/4)	**Fail**: well below a release bar
Release blockers	**2**	**Fail**: UAPMEERA:2, UAPMEERA:6
Failure consistency	Both blockers 4/4 failed	Deterministic, so a rerun will not clear them
Trend (last 4 runs)	25% → 25% → 50% → 50%	Improving, but has plateaued at 50%
Defects logged	None linked	**Gap**: no defect tracks either blocker
Overall risk	**HIGH**	**Recommend NO-GO**

What would turn this into a GO: both blockers pass in a fresh run of UAPMEERA:226, or the product owner signs off on each one as expected behaviour (see the note on UAPMEERA:2) and the test is corrected.

Blocking Failures

Test case	Failed check	History	Notes
UAPMEERA:6 Submit High-Volume Request	Verify Expression: `CBool(API Response.Accepted)` returned **False** (11:16:50 UTC)	Failed 4/4	High-volume loan requests are being rejected by the API. Most likely a real product defect in the core loan path. **Blocker.**
UAPMEERA:2 Submit Underage Request	Verify Expression: `CBool(API Response.Accepted)` returned **False** (11:16:46 UTC)	Failed 4/4	The test expects an underage applicant's request to be *accepted*. A rejection may be the correct business rule, so confirm the requirement with the product owner: either a product defect or a wrong test expectation. **Blocker until resolved.**

Results Breakdown

Key	Test case	Result	Duration
UAPMEERA:5	Submit Long-Term Request	**Passed**	8.1 s
UAPMEERA:4	Submit Low-Volume Request	**Passed**	5.2 s
UAPMEERA:2	Submit Underage Request	**Failed**	4.4 s
UAPMEERA:6	Submit High-Volume Request	**Failed**	3.7 s

Totals: Passed 2 · Failed 2 · None 0 · Restricted 0.

Frequently Failing Test Cases

Results across the four recorded runs of this test set (oldest to newest, UTC):

Test case	10-05 13:08	10-05 13:13	10-05 13:17	10-06 11:16	Failed
UAPMEERA:2 Underage	**F**	**F**	**F**	**F**	4/4 · consistent
UAPMEERA:6 High-Volume	**F**	**F**	**F**	**F**	4/4 · consistent
UAPMEERA:5 Long-Term	**F**	**F**	**P**	**P**	2/4 · recovered
UAPMEERA:4 Low-Volume	**P**	**P**	**P**	**P**	0/4 · stable
Pass rate	25%	25%	50%	50%	

Watch item: UAPMEERA:5 (Long-Term) failed in the first two runs and has passed in the last two. It is not a blocker today, but call it out as a residual risk until it holds green over more runs.

Evidence & Gaps

• Both assertions have screenshots attached in Test Manager (Assertion_1.jpg on each failed test case log). However, the screenshots show the robot host's desktop, not the UiBank application. These are API-level checks, so the screenshots add no diagnostic value. Recommend logging the API response body in the test so future failures are self-explaining.
• No defects are linked to either failing test case log. Raise defects before sign-off so the decision has an owner.
• The release decision rests on 4 runs, all from the last 24 hours on one machine. The history is thin.

Recommended Actions Before Sign-off

• Engineering: investigate why the loan API rejects high-volume requests (UAPMEERA:6). This is the primary blocker.
• Product owner: confirm the expected outcome for underage applicants (UAPMEERA:2). Then fix either the product or the test.
• QA: raise and link a defect for each blocker, then re-run UAPMEERA:226 after fixes land.
• Release Manager: hold the release (NO-GO) unless both blockers are cleared or formally waived.
